

<https://androzoo.uni.lu/lists>

Above is the link containing latest.csv file. Download and open the csv to see the first column containing SHA256 against each apk.

Below is the command with API key.

```
curl -O --remote-header-name -G -d  
apikey=3030571a2b7ddd64ca5e693d591bd712e4fa1c4ab25e01b4e8afada67f31bc06 -d  
sha256=0000003b455a6c7af837ef90f2eaffd856e3b5cf49f5e27191430328de2fa670  
https://androzoo.uni.lu/api/download
```

This command downloads one apk at a time since it uses one sha256 for that apk. You have to write a script that picks every sha256 from latest.csv and uses curl with api to download whole dataset.

The Androzoo API does not support "bulk download", but you can issue multiple GET requests to emulate this process.

For instance, you can use GNU Parallel or Python concurrent.futures modules. Since each request can be processed independently from the others, you should not have too much trouble implementing this solution.
